Security in IoT Ecosystem

Module 1

Introduction to Security in IoT

Prof.: Joaquín Recas

Table of Contents

Objective

Take a tour of the main attack vectors and vulnerabilities within the IoT field to carry out a security audit

- Describe what is IoT
- Identify the threats
- How to focus a security audit on IoT
- Good practices

Reviewing Concepts

- What is IoT?

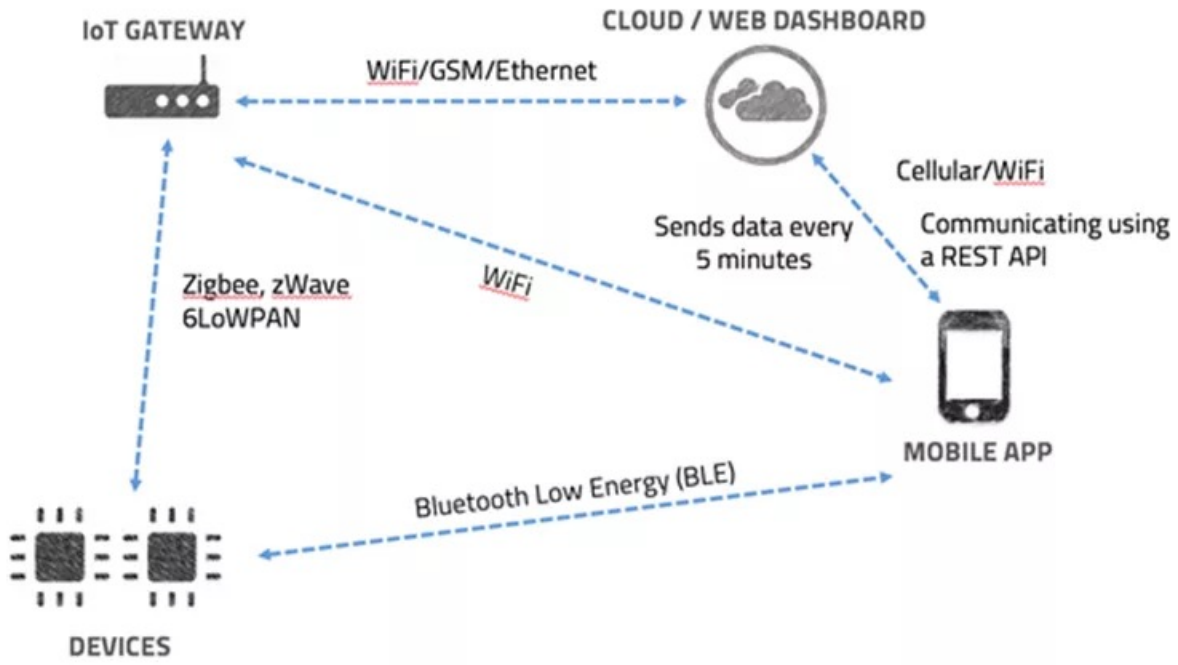
What is IoT?: Definitions

- International Telecommunication Union (ITU):
  - *Global infrastructure for the **information society**, enabling advanced services by **interconnecting** (physical and virtual) **things** based on existing and **evolving** interoperable information and communication technologies.*
- IoT European Research Cluster (IERC):
  - *A dynamic global network infrastructure with self-configuring capabilities based on standard and interoperable communication protocols where physical and virtual "things" have identities, physical attributes, and virtual personalities and use intelligent interfaces, and are seamlessly integrated into the information network.*

Reviewing Concepts

- What is so special about IoT?
  - It is not just a specific technology
  - Complete paradigm that brings together technologies, protocols, infrastructures and knowledge



Reviewing Concepts

- IoT Architecture
  - Hardware:
    - ARM, Intel…
    - Arduino, RasPi…
  - Software:
    - Tizen
    - Android Things
    - Windows 10 IoT Core
  - Interconnexion:
    - Wired (SPI, I2C)
    - Wirelesss: BLE, ZibBee, MQTT

Security in IoT

Are we really aware of the threats that affect IoT devices?

- If we are not, we can fall into a **poor perception of risk**, and overlook some of the attack vectors that can endanger its security.

The IoT problem

- Attributes of *secure* systems (**CIA triad**):
  - **Confidentiality**: the information is not available for unauthorised individuals
  - **Integrity**: data is maintained accurate and complete
  - **Availability**: the data must be available for authorised users
- Recommendation:
  - Non-repudiation: intention to fulfil obligations.

The IoT problem

- Security is not a product, it is a process
- Security restrictions make product development slower and more expensive
- Many bugs are discovered by chance
- The same problems that already existed in traditional systems

The IoT problem

- Auditing the security of an IoT device **is not an easy** (or cheap) **task**.
- Security controls should be evaluated:
  - web/cloud
  - In mobile applications (Android and iOS)
  - In the usual communications (WiFi or Ethernet)
  - In unusual communication protocols (Zigbee, BLE, …)
  - From the device itself (firmware analysis, binary analysis, etc.)
  - Hardware (I/O, reprogramming, power, radiation, etc.)

The IoT problem

- Hardware:
  - Computational and power constraints
    - Computationally expensive anti-malware/cryptographic algorithms
  - Memory restrictions
    - The algorithms designed were not intended for IoT
  - Physical access
    - Remote deployment without physical security
  - Attacks of interference or physical manipulation: Tempest (Video)

The IoT problem

- Software:
  - Embedded software restrictions
    - RTOS: Limited, network protocol stack and no modules for security
  - Dynamic updates
    - Complicated to correct bug or security flaws

The IoT problem

- Network:
  - Mobility
    - Variable physical status, may leave and join networks with different security settings
- Scalability
- Device heterogeneity
  - Variety of devices, difficulty in unifying security
- Heterogeneity protocols and channels
  - Local or global connections
- multiprotocol networks
  - Ex: within the same network, non-IP based devices
- Topologies

The IoT problem

- Cloud
  - Insecure interfaces and APIs
    - Review data authentication and encryption
  - insider threats
    - Credential theft: social engineering, shoulder sniffing or Advanced Persistent Threads
    - Employees of the organization itself
    - Natural or fortuitous disasters
  - Derivatives of shared technologies
    - In IaaS (Infrastructure as a Service) the hardware has not been designed for shared architectures, one hypervisor can see content from another
  - Loss or leak of information
    - Modification or removal attacks
    - Example: a MitM
  - Risks due to ignorance
    - 0-days attack

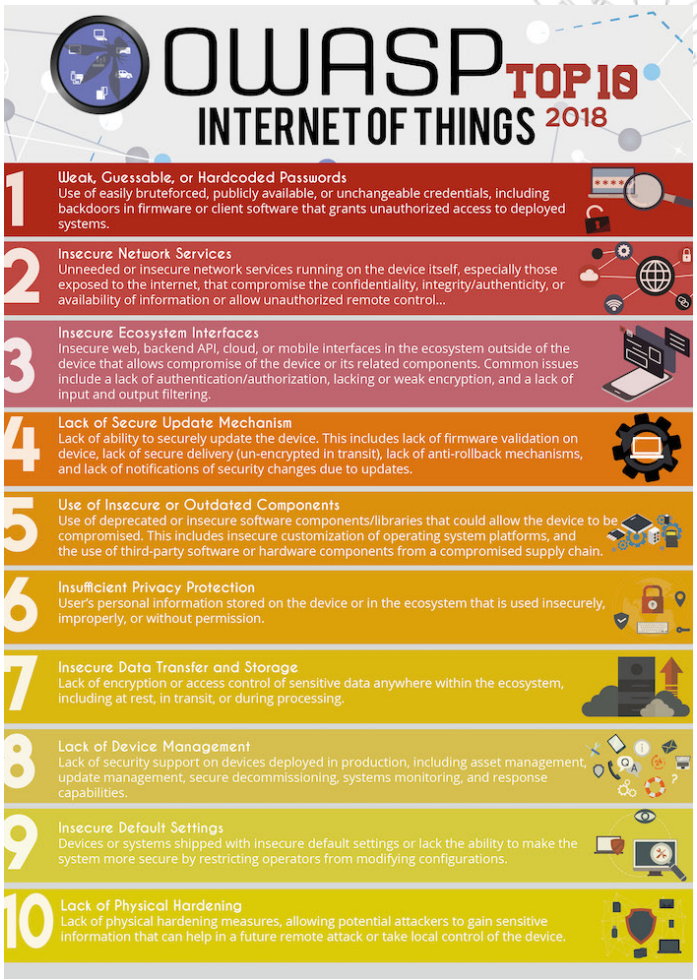
Table of Contents

- What is OWASP?
  - *Open Web Application Security Project*

- ***OWASP Internet of Things Project***
  - *The OWASP Internet of Things Project is designed to **help** manufacturers, developers, and consumers better **understand the security issues** associated with the **Internet of Things**, and to enable users in any context to make better **security decisions** when building, deploying, or assessing IoT technologies.*
  - *The project looks to define a **structure for various IoT sub-projects** separated into the following categories - **Seek & Understand, Validate & Test, and Governance.***

OWASP IoT Top 10

- IoT Top 10 2018
  - Top ten things to avoid when building, deploying or managing IoT systems.
- IoT Top 10 Mapping Project
  - Provides mappings of the OWASP IoT Top 10 2018 to industry publications and sister projects (2014 project).
- IoTGoat
  - Deliberately insecure firmware based on OpenWrt. The project's goal is to teach users about the most common vulnerabilities typically found in IoT devices



OWASP IoT Top 10 - 2018

- 1 Weak, Guessable, or Hardcoded Passwords:
  - *Use of easily bruteforced, publicly available, or unchangeable credentials, including backdoors in firmware or client software that grants unauthorized access to deployed systems.*
- 2 Insecure Network Services:
  - *Unneeded or insecure network services running on the device itself, especially those exposed to the internet, that compromise the confidentiality, integrity/authenticity, or availability of information or allow unauthorized remote control.*
- 3 Insecure Ecosystem Interfaces:
  - *Insecure web, backend API, cloud, or mobile interfaces in the ecosystem outside of the device that allows compromise of the device or its related components. Common issues include a lack of authentication/authorization, lacking or weak encryption, and a lack of input and output filtering.*

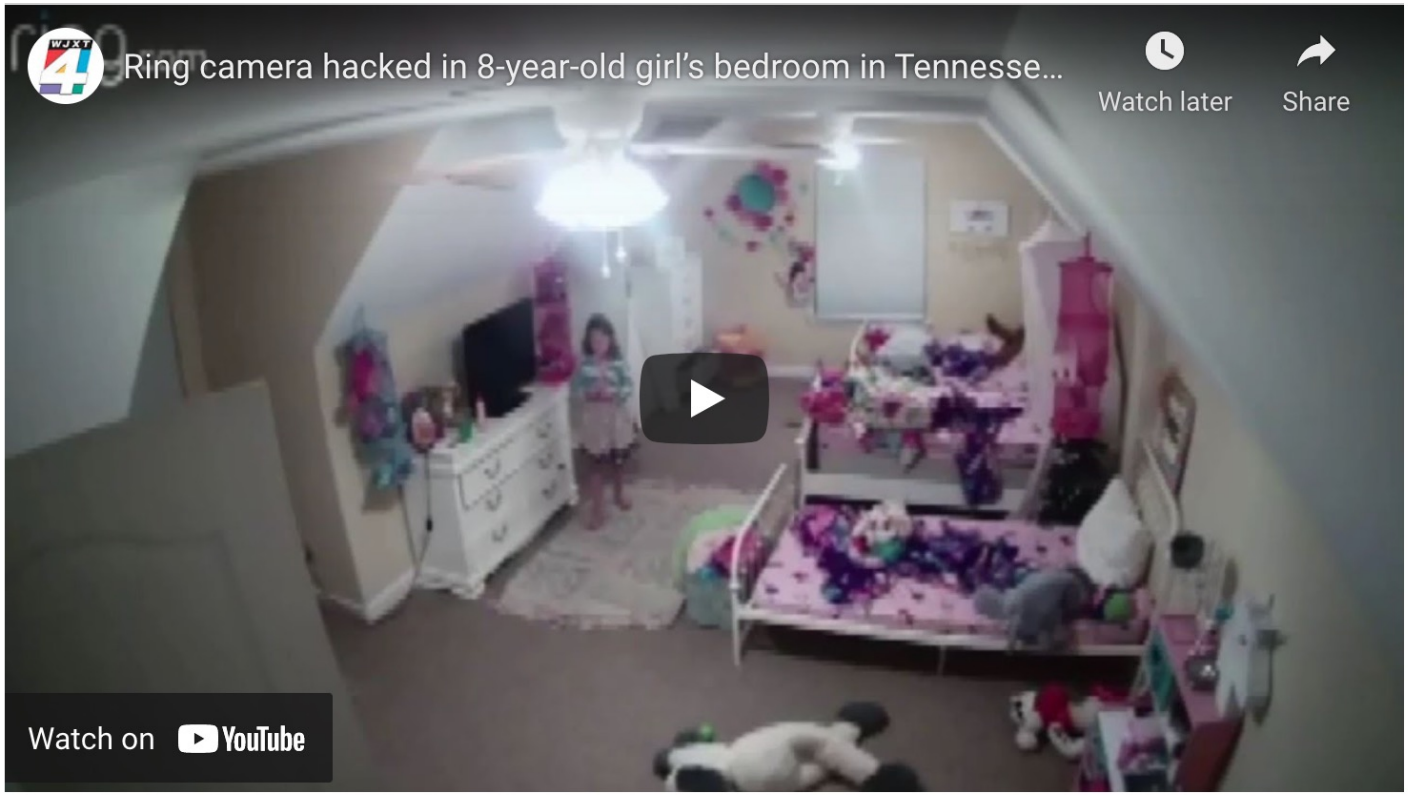
Creep hacks family's Ring camera, tells Mississippi girl he's 'Santa Claus'

By Jackie Salo

December 12, 2019 | 10:00am | Updated



MORE ON:
HACKERS

A creep hacked a Ring security camera and taunted an 8-year-old girl in Mississippi, telling her "I'm your best friend. I'm Santa Claus" through the security camera system, her parents claimed.

OWASP IoT Top 10 - 2018

- 4 Lack of Secure Update Mechanism:
  - *Lack of ability to securely update the device. This includes lack of firmware validation on device, lack of secure delivery (un-encrypted in transit), lack of anti-rollback mechanisms, and lack of notifications of security changes due to updates.*
- 5 Use of Insecure or Outdated Components:
  - *Use of deprecated or insecure software components/libraries that could allow the device to be compromised. This includes insecure customization of operating system platforms, and the use of third-party software or hardware components from a compromised supply chain*

- 6 Insufficient Privacy Protection:
  - *User's personal information stored on the device or in the ecosystem that is used insecurely, improperly, or without permission.*
- 7 Insecure Data Transfer and Storage
  - *Lack of encryption or access control of sensitive data anywhere within the ecosystem, including at rest, in transit, or during processing*

Sony admitted a great PSN hack

- 77m users' personal details were put at risk:
  - *"It was the largest security breach of its kind to ever hit console gamers, and an event with huge repercussions for PlayStation - both in the short term for its users, left for weeks without access to online services, and longer term as Sony sought to win back customer trust."*

- 8 Lack of Device Management:
  - *Lack of security support on devices deployed in production, including asset management, update management, secure decommissioning, systems monitoring, and response capabilities.*
- 9 Insecure Default Settings:
  - *Devices or systems shipped with insecure default settings or lack the ability to make the system more secure by restricting operators from modifying configurations*.
- 10 Lack of Physical Hardening:
  - *Lack of physical hardening measures, allowing potential attackers to gain sensitive information that can help in a future remote attack or take local control of the device*.

Tesla car doors can be hacked

by Jose Pagliery @Jose_Pagliery

March 31, 2014: 7:04 PM ET

A security researcher worries about the security of Tesla's computer systems.

Hackers can unlock a high-tech Tesla car door by using the same run-of-the-mill techniques they use to crack open computers.

The Armatix IP1 smart gun needs a special watch to open fire. Unless you have $15 worth of magnets.

Protection of an IoT infrastructure

- From 4 perspectives:
  - IoT Hardware Manufacturer/Integrator
  - IoT Solution Developer
  - IoT solution implementer
  - IoT Solution Developer

Protection of an IoT infrastructure

- IoT Hardware Manufacturer/Integrator
  - Limit the hardware to a few minimum requirements:
    - If I don't need USB port, don't put it
  - Create tamper-proof hardware:
    - HW capable of detecting physical tampering
  - Rely on secure hardware:
    - Secure/encrypted storage
    - Secure Boot with Trusted Platform Module
  - Apply updates safely
    - Secure paths
    - Crypto Assurance
    - evil grade

Protection of an IoT infrastructure

- IoT Solution Developer
  - Follow a secure software development methodology:
    - From conception to implementation
  - Choose open source software carefully
    - Review introduced components
    - activity level
  - Integrate carefully:
    - Monitor the functionalities offered by the APIs that we do not use

Protection of an IoT infrastructure

- IoT solution implementer
  - Deploy hardware safely:
    - Unsecured deployment locations
  - Keep authentication keys secure:
    - Device ID and authentication keys physically secured for communication with the cloud

Protection of an IoT infrastructure

- IoT Solution Operator
  - Keep the system updated:
    - SSOO and updated drivers
  - Protect against malicious activity:
    - AVS (address verification service)
    - IDS (intrusion detection system)
  - audit often
    - Audit as a response measure to incidents
    - Logs, logs, etc.
  - Protect credentials in the cloud
    - The input vector to the IoT infrastructure can be from the cloud
    - Strong passwords, periodic change and avoid access in public places
